

Abstract for Plastic Film Protector For Teflon Coated Skillets:

An invention to protect the teflon coating on skillets from being damaged while the skillets are stacked in storage. This measure prolongs the life and usage of the teflon coating on the skillets. This invention consists of five plastic film sheets of the same dimensions, positioned evenly on top of one another and heat fused together on three sides. The fusion converts the five plastic sheets into four separate pockets in which the skillets are inserted for protection.

Another advantage of this invention is when the skillets are stored in an open area, as on a counter top, the pockets will aid in shielding the skillets from dust and other airborne contaminants.
